Engineers Australia Collection on Informit

This presentation outlines a new full text online product developed in partnership between Engineers Australia and RMIT Publishing.

With 80,000 members, Engineers Australia is a peak professional association representing all disciplines and branches of engineering in the country. Engineers Australia works with government, industry and tertiary education providers to promote engineering as a discipline, and the professional development of our members.

The Engineers Australia Engineering Collection on Informit E-Library is a suite of full text resources comprising journal articles, conference papers, working papers and other grey literature. It is based on the Engineers Australia library collection and is the only database that covers all aspects of Australian engineering. The collection features 20,000+ full text articles published since 1980 and will be updated continually as new content is added to the collection.

Extensive collaborative work has been carried out by Engineers Australia and RMIT Publishing to document the potential collection, scan the papers, convert them into digital files, index and make papers available online. RMIT Publishing has chosen the Informit e-Library platform and publishing model rather than the older Plus Text model to have the information accessible in the most efficient, timely and flexible manner.

The power of the database stems from a high quality and purpose built index, which is freely accessible to all users, thus rendering it highly discoverable by all search engines. Full text content is available from RMIT Publishing either through package subscriptions, subscription to individual titles or to non-subscribers by a Pay-Per-View article service. Members of Engineers Australia will be able to readily access the new collection online via RMIT Publishing web site at no cost.
